How a Spin Resolves

Every spin runs the same path. Line wins are paid on a fixed 243-ways evaluation; the hidden Hard-Hat count decides whether the spin also opens the bonus, where most of the return (and all the volatility) lives.

Where the Return Comes From

The two paths above combine into the published Return-to-Player. The base game is deliberately light; the bonus carries the bulk of the return and essentially all of the volatility — which is why a true read

needs a ~10-million-spin simulation, not a short sample.

COMPONENT	ROUGHLY CONTRIBUTES	NOTES
Base game (243-ways lines + Wolf Wild)	~49% of bet	Frequent small wins — 26.4% hit rate
Bonus feature (free spins, houses, jackpot)	~48% of bet	Rare (1 in ~180) but large — avg ~85× bet when it hits
Total (Standard model)	97.07%	Lean model scales every value down to 84.59%

One source of truth. All of these numbers live in `src/math/par-sheet.js` and are verified by the headless simulator `tools/sim.js` (and re-checked live in the in-game  MATH and  SIM panels). Change a value once and the game, the sims and these docs all follow.
